KCD Austria 2nd Chance Edition

SSO for Kubernetes Using Dex

Let's get authenticated!

\$ whoami

Martin Nirlt

Solution Architect

I am an IT engineer  with strong backgrounds in software, DevOps/platform and electronic engineering working for [Mirantis](#) as a pre-sales solution architect. Next to my job, my main side-hustles are all around Kubernetes , IaC and automating things. From time to time, I even build little apps in Go or other languages.

[martinnirlt](#)

[martinnirlt](#)

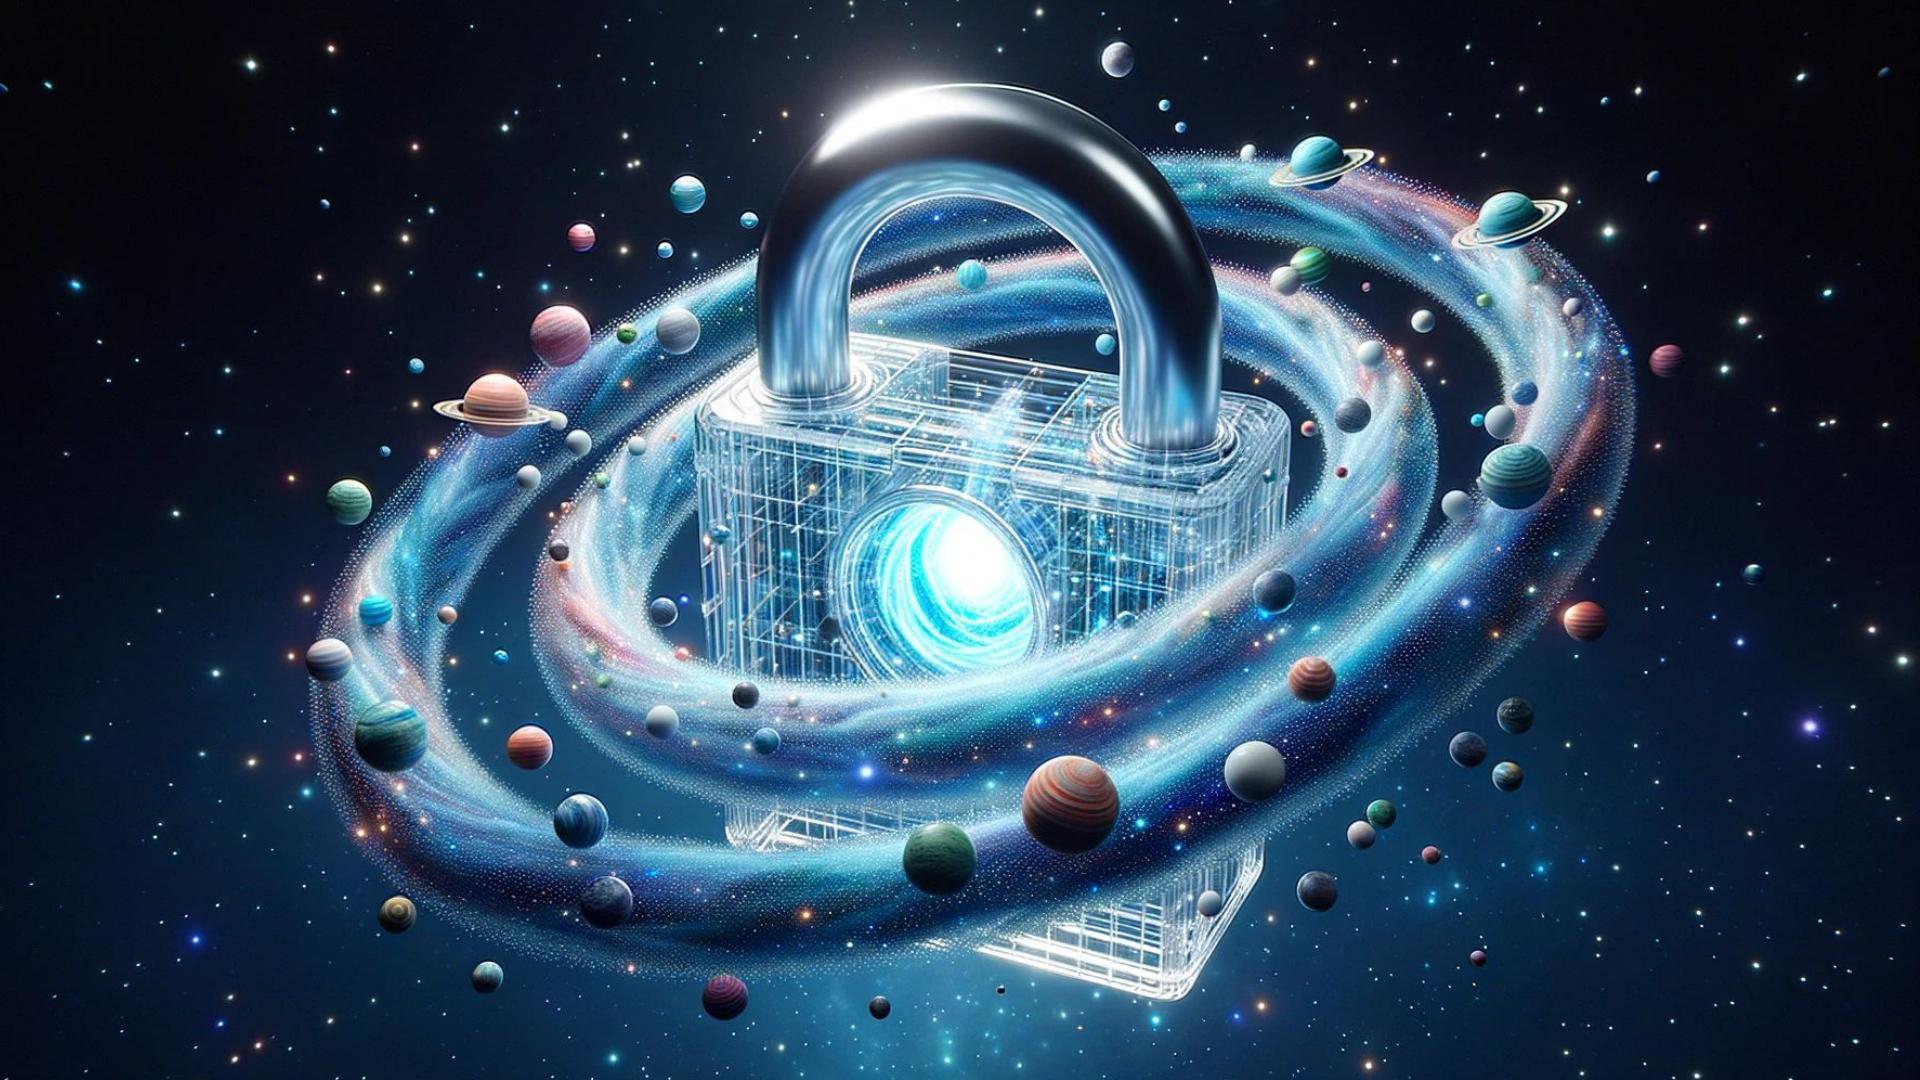

[martinnirlt](#)

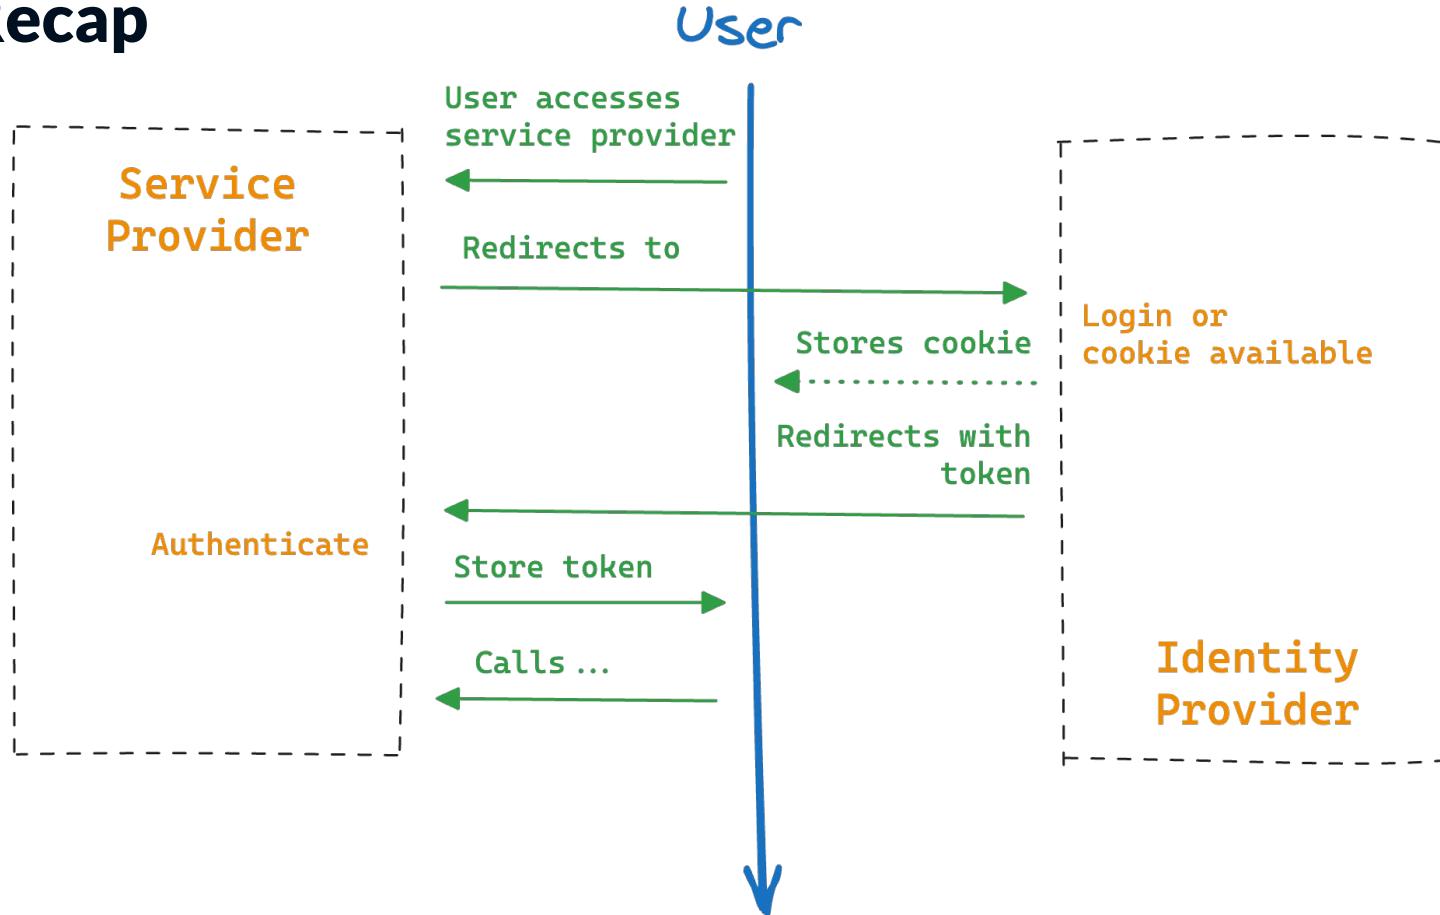

Single Sign-On

Let's do a quick recap!

SSO Recap

[Documentation](#)

Kubernetes Authentication

Reminder for Martin: Don't talk too much!

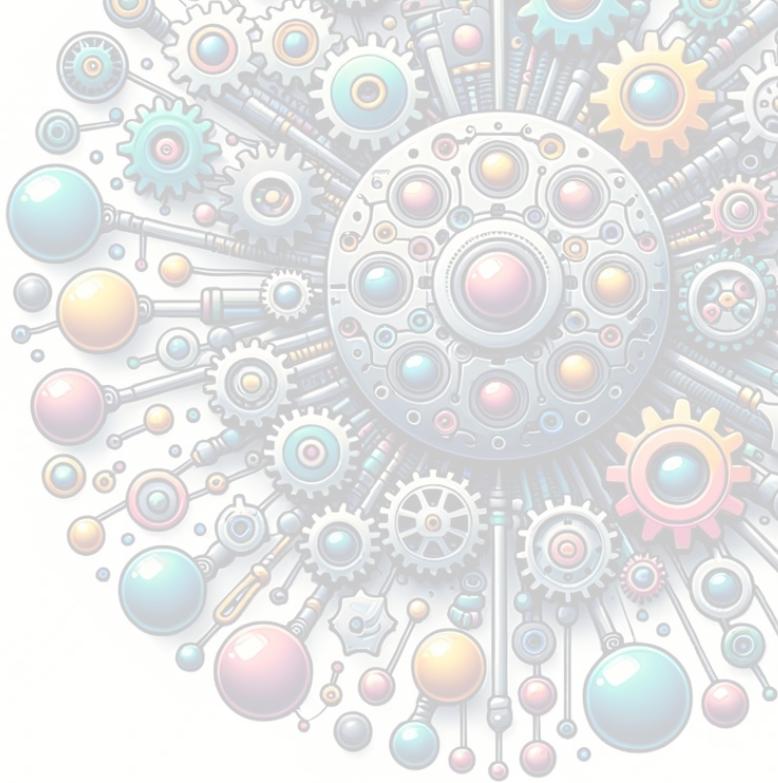

X509 Client Certs

- User Info stored in Cert Subject
 - Username: Common Name (CN=)
 - Groups: Organization fields (O=)
- Requires API-Server Params
 - client-ca-file
 - tls-cert-file
 - tls-private-key-file
- Generate certificates manually
- Use certificates.k8s.io API

```
Certificate:
Data:
  Version: 3 (0x2)
  Serial Number: 8937326423629948540 (0x7c07c307c22ce67c)
  Signature Algorithm: sha256WithRSAEncryption
  Issuer: CN=kubernetes
  Validity
    Not Before: Oct 17 18:17:59 2023 GMT
    Not After : Oct 16 18:18:00 2024 GMT
  Subject: O=system:masters, CN=kubernetes-admin

```

Bootstrap Tokens

- Bootstrapping new Clusters
 - Joining nodes, etc.
- Token Format
 - <token-id>.<token-secret>
 - [a-z0-9]{6}\.[a-z0-9]{16}
 - abcdef.0123456789abcdef
- Requires API-Server Params
 - enable-bootstrap-token-auth
- Authorization
 - Bearer <token>

Sample Bootstrap Token

```
apiVersion: v1
kind: Secret
metadata:
  # Name MUST be of form "bootstrap-token-<token id>"
  name: bootstrap-token-07401b
  namespace: kube-system
# Type MUST be 'bootstrap.kubernetes.io/token'
type: bootstrap.kubernetes.io/token
stringData:
  # Human readable description. Optional.
  description: "The default bootstrap token generated by 'kubeadm init'."
  # Token ID and secret. Required.
  token-id: 07401b
  token-secret: f395accd246ae52d
  # Expiration. Optional.
  expiration: 2017-03-10T03:22:11Z
  # Allowed usages.
  usage-bootstrap-authentication: "true"
  usage-bootstrap-signing: "true"
  # Extra groups to authenticate the token as. Must start with "system:bootstrappers:"
  auth-extra-groups: system:bootstrappers:worker,system:bootstrappers:ingress
```

Source: <https://kubernetes.io/...>

Static Token File

- Indefinitely lasting Tokens
- CSV File
 - <token>, <username>, <uid>, "<groups...>"
 - File on controller nodes
- Requires API-Server Params
 - token-auth-file
- API restart after update required
- Authorization Header
 - Authorization: Bearer <token>

Webhook Token Auth

- Arbitrary Auth-API
 - Receives TokenReview Object holding opaque token
 - Responds with TokenReview Object
- User fields in TokenReview
 - Required: username
 - Optional: uid, groups, extra
- Required API-Server Params
 - authentication-token-webhook-config-file

Source: <https://kubernetes.io/...>

```
{  
    "apiVersion": "authentication.k8s.io/v1beta1",  
    "kind": "TokenReview",  
    "status": {  
        "authenticated": true,  
        "user": {  
            # Required  
            "username": "janedoe@example.com",  
            # Optional  
            "uid": "42",  
            # Optional group memberships  
            "groups": ["developers", "qa"],  
            # Optional additional information provided by the user  
            # This should not contain confidential data,  
            # or API objects, and is made available to auditors  
            "extra": {  
                "extrafield1": [  
                    "extravalue1",  
                    "extravalue2"  
                ]  
            }  
        },  
        # Optional list audience-aware token authentication  
        # containing the audiences from the `spec.audiences` field.  
        # If this is omitted, the token is considered to be valid for all audiences  
        "audiences": ["https://myserver.example.com"]  
    }  
}
```

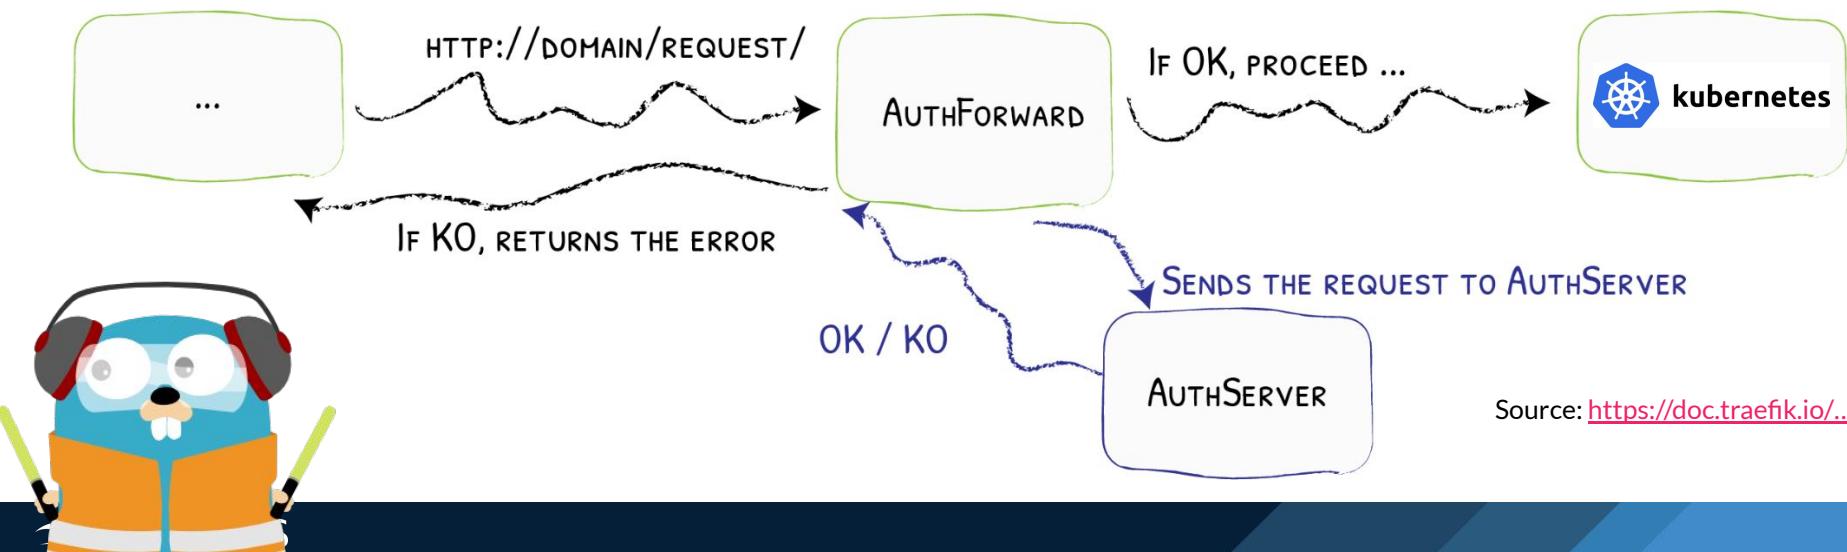

Authenticating Proxy

- Reverse Proxy in front of API-Server
- Example below: Traefik

- API-Server Params

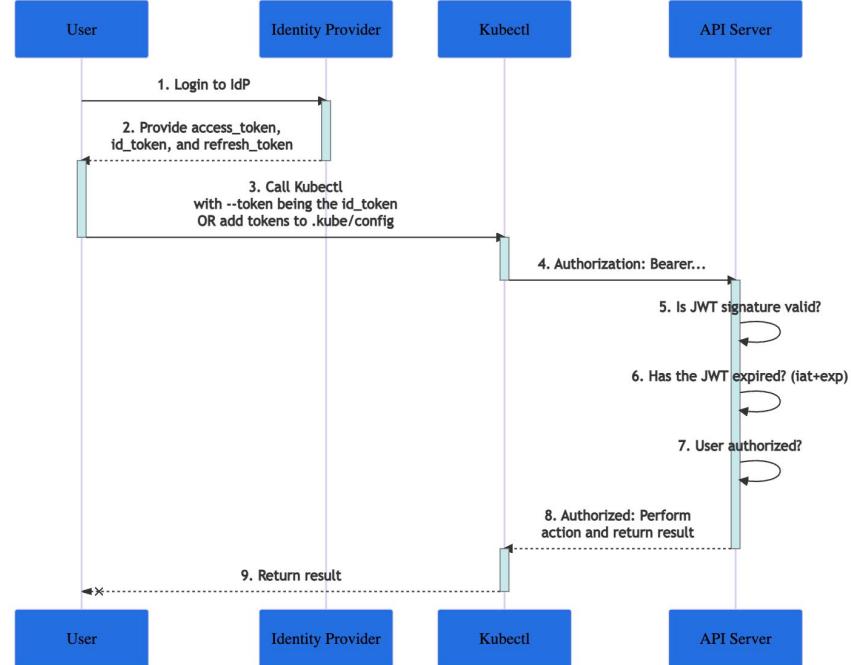

- Required: requestheader-username-headers
- requestheader-group-headers
- requestheader-extra-headers-prefix
- Required: requestheader-client-ca-file
- requestheader-allowed-names

~~Sorry for the slide~~

OpenID Connect Tokens ❤️

- Allows SSO Flow
 - Integrate Directory Services & IAM
 - Central User Management
- OIDC extends OAuth2
 - Uses `id_token` (not `access_token`)
 - JSON Web Token (JWT)
- API-Server Params
 - `oidc-issuer-url`
 - `oidc-client-id`

Service Account Tokens

- Associated with Pods
 - Operators, Controllers, etc.
- Workload Identity
 - service-account-issuer
 - service-account-jwks-uri
- Optional API-Server Params
 - service-account-key-file
 - service-account-lookup
- JSON Web Token (JWT)
- Can be stored in Secrets!

Kube Auth Strategies [Docs](#)

- X509 Client Certs
- Bootstrap Tokens
- Static Token File
- Webhook Token Auth
- Authenticating Proxy
- OpenID Connect Tokens
- Service Account Tokens
- Anonymous Requests

Good to know:

- Multiple modules possible
- First success short-circuits evaluation
- API server does not guarantee order
- Enable at least SA tokens and one user auth module

SSO

Comparison

OpenID Connect Tokens

-  Central
-  Short living
-  Easy to manage
-  No

Enterprise-grade Tooling 🎉

X509 Client Certs

-  Distributed
-  Long-living
-  Hard to manage
-  Easy to lose

Can be automated 😅
(Look left)

Dex

A Federated OpenID Connect Provider

- CNCF Project
- Federated OIDC Provider
- Integrate any Identity Provider
 - One Tool to Rule Them All 💍
 - Easy 🎉
- Integrates with Kubernetes
 - Via [kubelogin](#)

Bitbucket Cloud	yes	yes	no	alpha	
OpenShift	no	yes	no	stable	
Atlassian Crowd	yes	yes	yes *	beta	preferred_username claim must be configured through config
Gitea	yes	no	yes	alpha	
OpenStack Keystone	yes	yes	no	alpha	

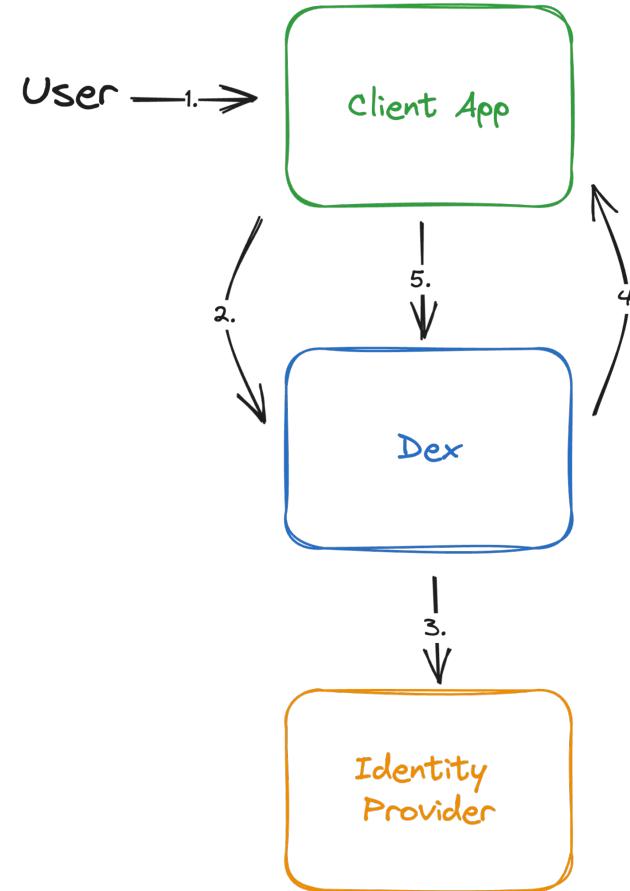

Dex Flow

[Read more...](#)

1. User visits client app
2. App redirects user to Dex with OAuth2 request
3. Dex determines user's ID
4. Dex redirects user back with a code
5. App uses code to exchange for a token (ID token)

Dex is not bound to Kubernetes!

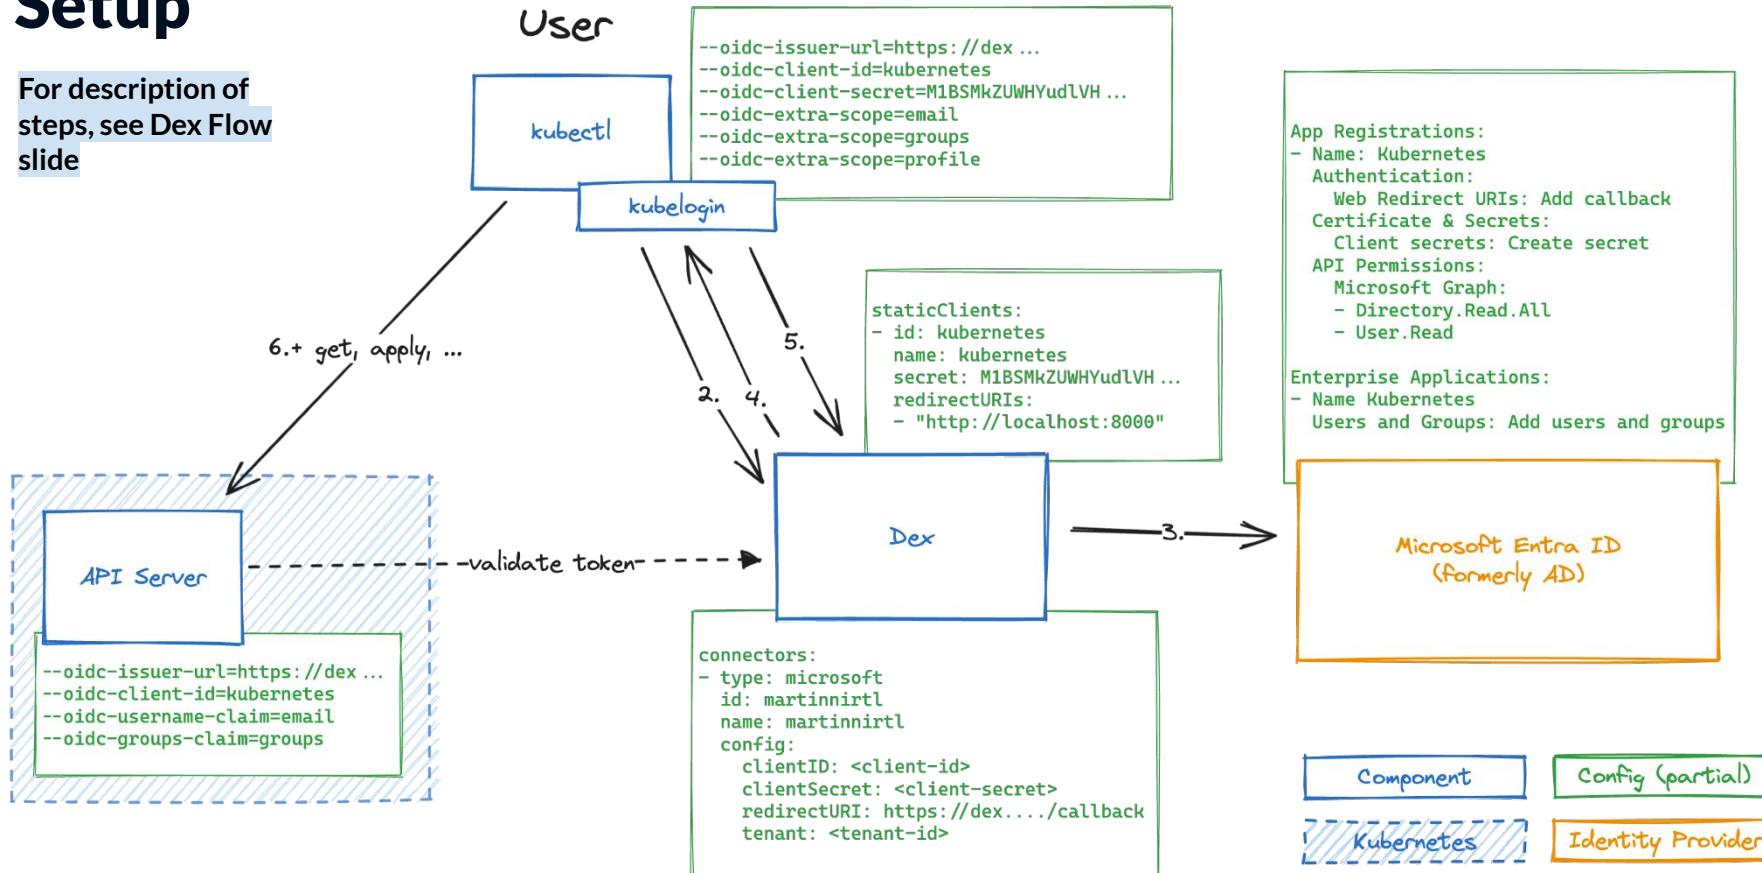

Demo

Let's get authenticated!

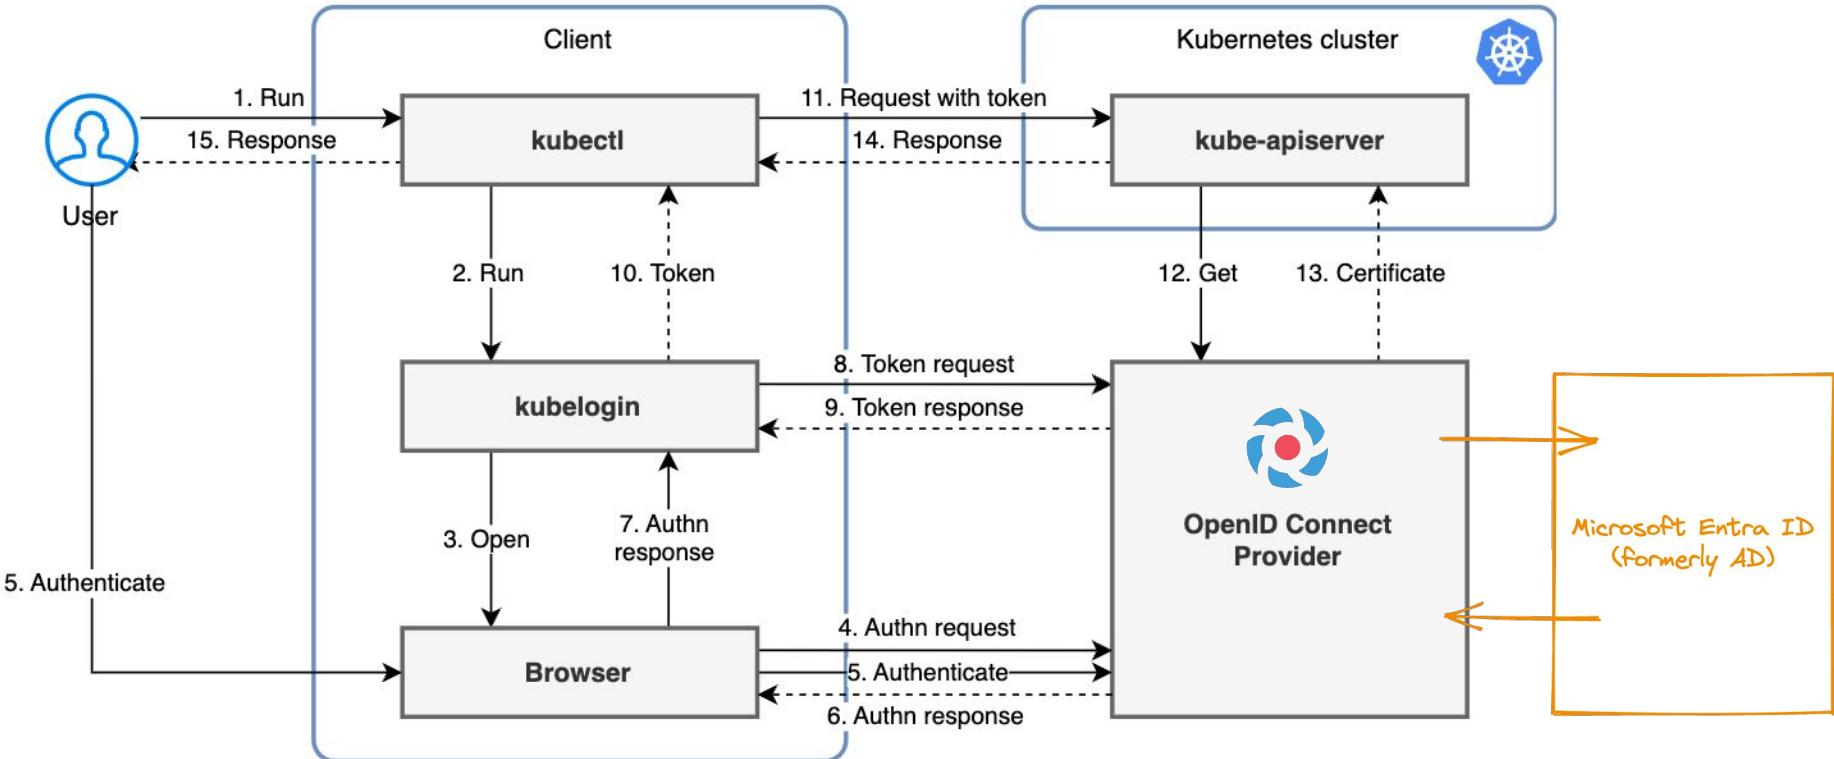

Setup

For description of steps, see Dex Flow slide

Kubelogin Flow

(Source: <https://github.com/int128/kubelogin>)

Beyond Authentication

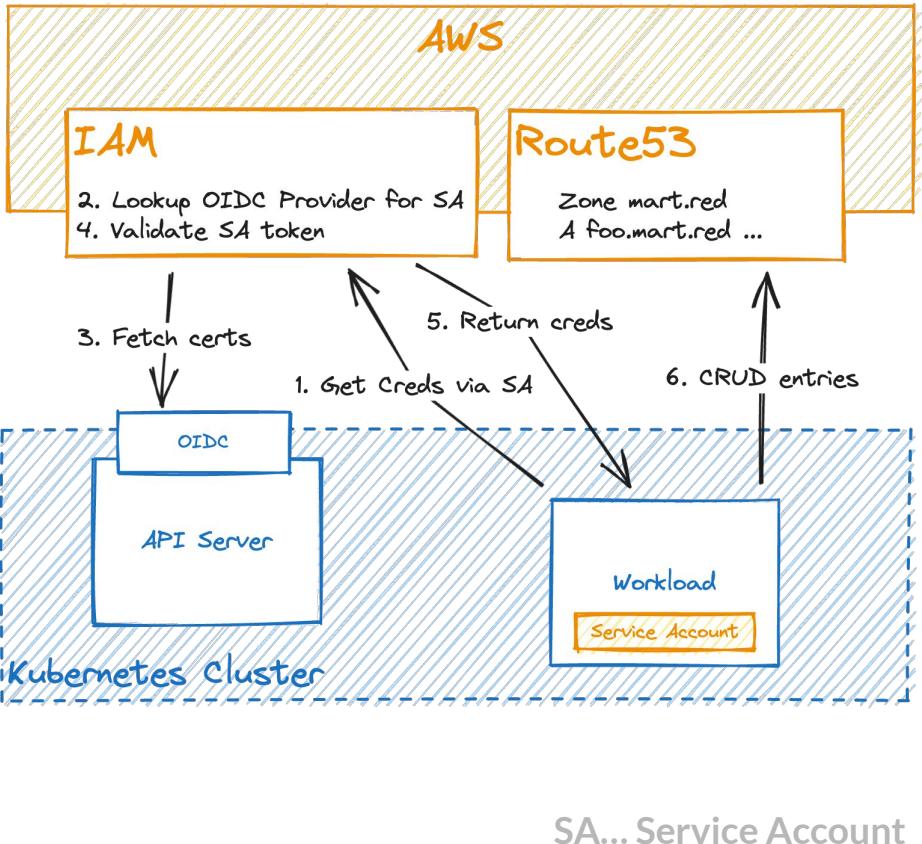

Hmm... What else could there be?

Authorization

- AUTHN vs. AUTHZ
- Central Management and Standardized Roles are Key!
- Nice tools to keep you sane (and reduce effort) 😎
 - Fairwinds' [RBAC Manager](#) - Roles and Bindings on Steroids
 - Fairwinds' [RBAC Lookup](#) - Search roles for a user, service-account or group
 - [Audit2RBAC](#) - Create roles from audit logs
 - [Paralus](#) - Zero trust Kubernetes with zero friction
 - [Teleport](#) - Open Infrastructure Access Platform

Workload Identity

- Assign identities to Workloads
 - E.g. Assume IAM role on AWS
 - Available on GKE & AKS as well
 - No explicit credentials needed
- Uses SA token to retrieve credentials
- OIDC used to verify token
 - OpenID Config Doc
 - JSON Web Key Set (JWKS)

SA... Service Account
